Data Structures Practical

Practical - VIII

Roll No. :S011	Name: Nidhi Gupta
Class : SYBSCIT	Batch : 1
Date of Assignment :12/08/2026	Date/Time of Submission : 12/08/2026

Sorting Algorithms:

Write programs to implement and compare the following sorting algorithms:

a. Bubble sort

Code:

```
# Bubble sort in Python

def bubbleSort(array):

    # loop to access each array element
    for i in range(len(array)):

        # loop to compare array elements
        for j in range(0, len(array) - i - 1):

            # compare two adjacent elements
            # change > to < to sort in descending order
            if array[j] > array[j + 1]:

                # swapping elements if elements
                # are not in the intended order
                temp = array[j]
                array[j] = array[j+1]
                array[j+1] = temp

data = [-2, 45, 0, 11, -9]

bubbleSort(data)

print('Sorted Array in Ascending Order:')
print(data)
print("Nidhi S011")
```

Output:

```
===== RESTART: C:/Users/nidhi/Downloads/N
Sorted Array in Ascending Order:
[-9, -2, 0, 11, 45]
Nidhi S011
```

b. Insertion sort

Code:

```
# Selection sort in Python

def selectionSort(array, size):

    for step in range(size):
        min_idx = step

        for i in range(step + 1, size):

            # to sort in descending order, change > to < in this ]
            # select the minimum element in each loop
            if array[i] < array[min_idx]:
                min_idx = i

        # put min at the correct position
        (array[step], array[min_idx]) = (array[min_idx], array[step])

data = [-2, 45, 0, 11, -9]
size = len(data)
selectionSort(data, size)
print('Sorted Array in Ascending Order:')
print(data)
print("Nidhi S011")
```

Output:

```
===== RESTART: C:/Users/nidhi/Downloads/N
Sorted Array in Ascending Order:
[-9, -2, 0, 11, 45]
Nidhi S011
```

>

c. Selection sort

Code:

```
# Insertion sort in Python

def insertionSort(array):
    for step in range(1, len(array)):
        key = array[step]
        j = step - 1

        while j >= 0 and key < array[j]:
            array[j + 1] = array[j]
            j = j - 1

        # Place key at after the element just smaller than it.
        array[j + 1] = key

data = [9, 5, 1, 4, 3]
insertionSort(data)
print('Sorted Array in Ascending Order:')
print(data)
print("Nidhi S011")
```

Output:

```
==== RESTART: C:/Users/nidhi/Downloa
Sorted Array in Ascending Order:
[1, 3, 4, 5, 9]
Nidhi S011
>
```

Comparison:
